1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Shoichi et al as cited by applicant in view of Ma et al .

Shoichi et al disclose motor control for ac motor including current detection circuit and current control means for determining voltage commands in accordance with target current corresponding to a target value of torque and pwm, see abstract. Shoichi et al lacks disclosing current control means comprises normal mode current control means, abnormal mode current control means for abnormal mode and abnormality decision means for detecting abnormality of motor or inverter, and changeover mean for selecting either normal mode current control means or abnormal mode control means. Ma et al disclose motor control wherein current control means comprises normal mode current control means for use in a normal mode, abnormal mode current control means for use in an abnormal mode, abnormality decision means for detecting an abnormal state of the motor or inverter, and changeover means for selecting either the normal mode current control means or abnormal mode current control means on the basis of a command from abnormality decision means , wherein in case of occurring abnormality to one phase of motor or the inverter, the abnormal mode current control means is selected by changeover means and abnormal mode multiphase voltage command generated by abnormal mode current control means are set as the multiphase voltage

command for switching element drive circuit. , see paragraph 6, 28, and claim 12. It would have been obvious to one of ordinary skill in the art to combine the motor control of Shoichi et al with current control means of Ma et al for improved control.

3. Claims 16-28 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
